

FORAGE SUITABILITY GROUP

Clayey Subsoil

FSG No.: G102BY210SD

Major Land Resource Area: 102B - Till Plains

Physiographic Features

These soils are predominately located on uplands or on floodplains. Those located on floodplains have improved drainage caused by upstream dams which have reduced flooding and lowered water tables.

	<u>Minimum</u>	<u>Maximum</u>
Elevation (feet):	980	1640
Slope (percent):	0	9
Flooding:		
Frequency:	None	Rare
Duration:	None	Very Brief
Ponding:		
Depth (inches):		
Frequency:	None	None
Duration:	None	None
Runoff Class:	Low	Very high

Climatic Features

Annual precipitation varies widely from year to year in MLRA 102B. Average annual precipitation for all climate stations listed below is about 24 inches. Over 75 percent of that occurs during the months of April through September. On average, there are about 30 days with greater than .1 inches of precipitation during the same timeframe. Precipitation is less than needed for optimum forage production and is the single largest factor limiting production from this group on non-irrigated lands.

Average annual snowfall ranges from 25 to 39 inches across the MLRA. Snow cover at depths greater than 1 inch range from 15 days at Bridgewater to 79 days at Madison.

Average July temperatures are about 75°F and average January temperatures are about 15°F. Recorded temperature extremes in the MLRA are a low of -36 degrees and a high of 110 degrees both recorded at Sioux Falls.

Average annual wind speeds at Sioux Falls are 11 mph with the highest wind speeds occurring during March and April. It is cloudy an average of 157 days a year at Sioux Falls, with the greatest incidence of cloudy weather occurring in November and December. Average morning relative humidity in June is 82 percent and average afternoon humidity is 59 percent.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data, access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

Soil Interpretations

This group consists of very deep, somewhat poorly to well drained, moderately fine to fine textured soils formed in glacial till on uplands or sediments on flood plains. Some of these soils are loamy on the surface, but all have clayey subsoils. Permeability is very slow to moderately slow.

Drainage Class:	Somewhat poorly drained	To	Well drained
Permeability Class:	Very slow	To	Moderately slow
(0 - 40 inches)			
Frost Action Class:	Low	To	High

	<u>Minimum</u>	<u>Maximum</u>

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed at <http://plants.usda.gov/>.

<u>Cool Season Grasses</u>	<u>Dryland</u>	<u>Irrigated</u>
Canada wildrye	F	NS
Green needlegrass	G	NS
Intermediate wheatgrass	G	G
Meadow brome	G	G
Orchardgrass	F	G
Pubescent wheatgrass	G	G
Smooth brome	G	G
Tall fescue	F	F
Tall wheatgrass	F	NS
Timothy	NS	F
Virginia wildrye	F	NS
Western wheatgrass	F	NS

<u>Warm Season Grasses</u>	<u>Dryland</u>	<u>Irrigated</u>
Big bluestem	G	G
Indiangrass	F	G
Little bluestem	F	NS
Sideoats grama	F	NS
Switchgrass	G	G

<u>Legumes</u>	<u>Dryland</u>	<u>Irrigated</u>
Alfalfa	G	G
Birdsfoot trefoil	F	G
Canada milkvetch	F	NS
Cicer milkvetch	G	F
Illinois bundleflower	F	NS
Purple prairieclover	F	NS
Red clover	F	G
White prairieclover	F	NS

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

NS - Not suited

Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	Dryland		Irrigated	
	Management Intensity		Management Intensity	
	<u>High</u> (lbs/ac)	<u>Low</u> (lbs/ac)	<u>High</u> (lbs/ac)	<u>Low</u> (lbs/ac)
Alfalfa	8600	4000		
Alfalfa/Intermediate wheatgrass	7700	3500	14300	8600
Alfalfa/Smooth brome	7700	3500	14300	8600
Big bluestem	8000	3700		
Intermediate wheatgrass	6600	2800	11400	6900
Smooth brome	6600	2800	11400	6900
Switchgrass	8000	3700		

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Soil Limitations

The primary limiting factors to these soils are their tight, slowly permeable nature, and moderate salinity of the subsoils of some soils. The less than ideal rooting zone and slow permeability reduce species choices and production potential. Water holding capacity ranges from low to high. Forage production on soils of low and moderate water holding capacity will be noticeably affected during dry growing seasons. Somewhat poorly and moderately well drained soils will be more prone to compaction and plant damage if grazed during wet periods. On steeper slopes, water erosion is a potential problem during establishment when renovating stands, and in thin established stands. Livestock trail erosion is a potential problem in established stands.

Management Interpretations

The impact on yields due to the tight, slowly permeable nature of these soils, and moderate salinity in some of their subsoils can be reduced by selecting species adapted to those soil conditions when establishing new stands or renovating stands. To reduce compaction exclude livestock and machinery during extended wet periods. Including sod forming grass species in stands, especially on steeper slopes will reduce the potential for sheet and rill erosion. Incorporate erosion control practices during the establishment period. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, and evenly distribute grazing pressure.
